Re: Product Operations Manager, 7f963a7a

Dear Benepass Hiring Team,

An e-commerce release reaches the real world when a customer can find the right tool, a promotion behaves as promised, staff can answer the next question, and the team can see what happened afterward. For Harry J. Epstein Company, an eighty-plus-year-old industrial retailer, I led interconnected e-commerce, analytics, content, marketing, and operational improvements that contributed to a period of twofold revenue growth. Modernization worked because the public product and the operating practice moved together without losing the trusted voice of the business.

That is why Benepass's Product Operations Manager role feels so closely matched to my work. For more than fourteen years, I have turned product, engineering, customer, and operational inputs into work-back plans, readiness criteria, risk and dependency maps, UAT and QA, launch communications, support paths, accountable owners, and post-launch learning. The problem is not only whether a feature can ship; it is whether the organization can absorb the change, care for the customer, and make a sound next decision.

At WOW List, I co-built and operated a natural-language community-calendar platform with Richard Caceres, connecting product definition and technical implementation to organizer onboarding, support, weekly email, embeds, instrumentation, and low-cost production operations across dozens of city ecosystems. In civic and coalition work, I have built durable decision records and runbooks that allow distributed collaborators to continue without making one person the permanent bottleneck. Across these contexts, I make tradeoffs legible: what the evidence supports, which downstream effect matters, who owns the decision, and what must be learned after launch.

I would bring Benepass a product-operations practice grounded in customer care, technical fluency, candid risk reporting, and usable systems. I would welcome a launch-readiness exercise or conversation about how your Product, Engineering, Customer Operations, and go-to-market teams resolve a difficult go/no-go decision—then preserve the result as a better operating pattern for the next launch.

Warmly,

Jamie Burkart
