Re: Operations Manager — SPEED, Job ID 789810

Dear NYC Office of Technology and Innovation Hiring Team,

With Tired of Tires, a discarded tire was never only a disposal problem. For a resident, it could be an expense, a hazard, or one more sign that the conditions outside the front door did not matter. The recurring free service connected print and web outreach, form and phone intake, scheduled field collection, volunteer participation, public reporting, and a City recycling handoff. I helped deliver the pickup operations and co-built the structures around them. What made the service usable was not one heroic collection day; it was a dependable chain of people, information, equipment, dates, and next actions.

That is the kind of operating problem I would be glad to take on as SPEED Operations Manager. Across KC Town Hall, Thick Arts, WOW List, NYC Artist Coalition, and FairRentNYC, I have translated ambiguous incoming needs into owned work; coordinated vendors, collaborators, technical systems, public-benefit requirements, and government-facing dependencies; and maintained the status, decisions, risks, and documentation that let other people act. KC Town Hall joined municipal compliance and vendor coordination to a \$490,539 public funding request. Thick Arts joined product delivery to the practical operations of an enduring small business. FairRentNYC's shared campaign memory gives a distributed coalition one place to recover decisions, owners, and unresolved questions.

The decisive point for me is this: operational rigor is not paperwork around the work. It is the means by which budgets, procurement, legal and cyber review, staffing, product dependencies, and team health become legible enough to manage honestly. My role is to establish only the structure the team needs, surface the blocked decision early, and remove process when its cost exceeds its value.

I would welcome a structured conversation about how SPEED receives requests, allocates resources, tracks financial and delivery health, and learns across projects. A strong operating system should leave the team less dependent on any one person and more able to keep its commitments to the New Yorkers waiting on the other side of a permit.

Warmly,

A handwritten signature in black ink, appearing to read 'Jamie Burkart', with a long, sweeping horizontal line extending to the right.
