Re: Engineering Project Manager, Job 5160542007

Dear CodePath Hiring Team,

At WOW List, the public interface could begin with one collaboratively editable field: an organizer wrote an event in ordinary language, and the platform made it available to people looking for what was happening around them. Behind that simple surface were Python/Django, Ember.js, PostgreSQL/PostGIS, releases, production operations, organizer support, and a distributed network of maintainers. The work was not only shipping features. It was keeping the path from a reported need to an owned issue, a tested change, a clear release, and a supported user intact.

That is the work I would bring to CodePath as Engineering Project Manager. Across fourteen years of public-facing web and civic systems work, I have translated ambiguous requests into scoped backlogs, requirements, acceptance criteria, action and decision logs, release checklists, UAT, regression expectations, and durable handoffs. I work directly in modern and legacy web stacks, reproduce defects, inspect behavior and logs, document expected and actual results, coordinate fixes, and verify releases. I also remove process when it costs the team more attention than it returns. The question is not whether a small engineering team can add another ritual. It is whether everyone can see the next consequential decision without carrying unnecessary ceremony.

CodePath's combination of delivery coordination, hands-on quality ownership, and responsible use of AI is unusually close to my practice. I use AI-assisted research, coding, documentation, and evaluation inside human-reviewed workflows with deterministic checks and explicit failure states. My strongest QA evidence is in issue reproduction, acceptance criteria, UAT, regression planning, and release verification; I would welcome a practical exercise that tests that work and clarifies the depth you need in Ruby- and Capybara-specific automated testing.

I would be glad to discuss how I could help engineers, Product, and internal users share one accurate view of delivery, quality, blockers, and fixes—and leave the team with systems it can continue to improve.

Warmly,

A handwritten signature in black ink, appearing to read 'Jamie Burkart', with a long, sweeping horizontal line extending to the right.
